This is my first graphics card mod. It all started when I realized that my GeForce2 MX just didn't pack enough punch at 175core/166mem. With a little help from [allelectronics](#) (heatsink, fan & grill), and [Dallma nn Computers](#) (artic silver thermal epoxy), I can now run this card up to 235/225.

That's a 35% overclock! w00t!

Some people thought that this was a bit overkill, however, I've modded three Asus V7100's the same way and no one seems to be complaining.

This is a relatively cheap mod that I recommend for almost all graphics cards. Stock cooling just doesn't cut it.
