---

The new Yogo Book from Lenovo is a pretty nifty device as the keyboard is entirely a touchscreen. While the principle seems solid, the feel and execution of it on the Android version left some people feeling a little let down. Let's face it, typing on a touchscreen sucks when compared to a physical keyboard on a laptop. The Windows version is basically the same thing - but does the execution work better in Windows? Check the review below to find out.

*Lenovo's Yoga Book is a device that's hard to describe. It's a tablet, a 2-in-1, and sort of a laptop. The keyboard isn't really a keyboard at all, but instead it's a touchscreen, which allows the keyboard to disappear at times to allow the user to take notes or draw.*
