There are some rumors that NVIDIA is responding to AMD's recent graphics card surprise with one of their own. The GTX 1080 Ti is rumored to be coming and it looks like a solid upgrade and have more of a Titan-X performance package. It looks like it could start off with a 10GB memory package and offer some insane performance numbers. While we will have to wait a little bit to see how it all shapes up, it looks like it could be coming soon rather than later. Details can be translated from NordicHardware below.

Earlier rumors that Geforce GTX 1080 Ti is equipped with the corresponding GP102 GPU Titanium X. Our sources could not confirm some of the earlier specifications leaked online but follow its previous Nvidia Ti launches sounds the following program likely. Slightly fewer CUDA units and smaller amount of memory than the Titanium X but with higher frequencies that provide similar computing power.
