I have to admit, I almost cried tears of joy when I saw [this post over at Engadget](#) . they are talking about the prototype 4K display from ViewSonic and I couldn't be happier. We've been stuck at a maximum resolution of 2560x1600 on the PC (single display) for a while now, and this could be loads of awesome. Unfortunately, you'll need a full Core i7 system to run it - oh, and about the same money as you'd need to buy a car. Still, cool stuff.

The current iteration requires 2x dual-link DVI, but would be compatible with 2x DisplayPort in the future. ViewSonic reps say the VP3280, which will be marketed towards film studios, broadcasters, photographers and any other professionals in need of a compact 4K display, could ship by the end of the year, costing "about the price of a car."
