

## Macbook Headphone Fail

---

Apple said it was "courageous" to pull the headphone jack on their iPhone 7 and give you a dongle to plug regular headphones into the lightning jack, but lightning headphones were so much better. They just released their Macbook Pro and in addition to NOT having a lightning connecot, the kill the USB port as well. Thankfully they included a standard headphone jack, but a dongle won't work if you want to plug in your shiny lightning headphones. Enjoy your dongle-fest. There will be a USB-C to Lightning dongle and you can plug that dongle into another dongle for more ding-dongle clutter. Thanks Apple.

*This according to teardown house iFixit, which noted in its dissection report that the new MacBook Pro (the one model that doesn't have the Touch Bar) still uses a 3.5mm headphone jack, and does not contain a Lightning input.*
