---

While there have been some decent gadgets released in 2016, there really hasn't been anything too spectacular in my opinion. We saw a few new pieces of hardware hit the shelves, but I think there were more notable products that were horrible in 2016. I don't entirely agree with the choices listed at the link below, but it's not too far off. Make sure to check them out below.

*Lenovo thought it was taking a page out of the Star Trek playbook when it skipped a physical keyboard on the Yoga Book in favor of a digital sketchpad. It wasn't. The writing surface is nearly impossible to type on unless you use the two-finger hunt-and-peck method from middle school, and the device requires a stylus for freehand drawing and note-taking. Heck, you can't rest your fingers on the keys without activating them. Seriously, use a pen and paper instead.*
