

LG's 4K Monitor Puts Four Displays in One Panel

Written by Benjamin "Zeus" Heide

The resolution of a 4K panel is exactly four times that of a 1080p display. With that in mind, LG has taken one of their 42.5-inch 4K units and given it a unique feature. It can run different devices all at once, or become a very nice 4K unit all on it's own. It has four HDMI ports, a USB-C port as well as other features that make it super interesting for those of you that need flexibility in your work-space.

With all those ports, the monitor can act as a screen for up to four different devices simultaneously, using a variety of split-screen configurations and picture-in-picture support. Using the two standard USB 3.0 ports, the monitor can also control two computers from a single mouse and keyboard. Finally, with two built-in Harman Kardon speakers and an included remote control, the panel could easily double as a 42.5-inch 4K TV once all the spreadsheets are closed.
