---

If you really need to get your Bitcoin mining going, you need to add another GPU to your rig - or a total of 13 - whichever the case may be. ASRock has just put together a pretty amazing little board for a mere \$140 that can support up to 13 graphics cards. You will need a pretty solid PSU to make it happen, but that's easy when compared to cramming 13 graphics card slots on a single E-ATX motherboard. Check it out.

*Last month at Computex, ASRock announced that its new H110 Pro BTC+ cryptocurrency mining motherboard will support 13 GPUs through PCI-e. However, the only way you can effectively use all that potential is by running Linux, until Microsoft patches this arbitrary limitation in Windows. The motherboard will cost a reported \$140, which is an excellent price and option, especially for those that were thinking about building a unit with more than six cards.*
