My latest laptop is packing some Ryzen goodness, and it seems that Dell is on board with AMD processors as well. I've got to hand it to Dell, because they actually try some different things. They are one of the few companies that have Linux machines available to buy online and now they are packing a bunch of new Inspiron machines with AMD. They aren't high-end machines, but it's a start.

With the Ryzen 3 and 5 series chips inside (and more specifically, the 2200u and 2500u processors), depending on how much you pay, supported by up to 32GB of user-upgradeable RAM, Dell wants you to think these machines offer great bang for your buck.
