---

If you need some handy portable storage, your best bet is a flash drive. These things are small, compact, and can hold a whackload of information. [PyroPort](#) takes a look at the USB2.0 version of [Crucial's latest drive](#) [over here](#) . This unit also features some security as you can set a password to view files on the Gizmo!

"Changing the size of the protected partition will wipe the Gizmo!, so you better make sure you've backed up those files first! Another slight niggle is that you cannot access both areas of the Gizmo! simultaneously. In order to access the protected area or vica-versa after viewing one area, you need to remove and reinsert the Gizmo! ."
