While the Galaxy S8 hasn't been out very long at all, the speedy release cycle rears its ugly head and shows us that companies are well on their way with the next phone before the current phone even hits the market. The result is the S9/S9+ and the specifications that have leaked. It is rumored to have dual rear-facing cameras, USB-C, Cat 18 LTE support (1.2Gbps download) and Qualcomm's Snapdragon 845 processor.

Samsung plans to equip the Galaxy S9 with souped-up iris and face recognition tools, according to a report at ET News. The report claims that the firm is "developing software to increase the face recognition rate of the Galaxy S9 front iris recognition sensor." Industry insiders claim that these improvements come as Samsung looks to take on Face ID, which Apple is touting as the most secure face-scanning tech on the market today.
